AUTHORS:

Resources of Raw Materials and Coking Technology of the
Donets Gas Coals on the Coking Gas Works

TITLE:

Donets Gas Coals, 1959, Nr 10, pp 5-8 (USSR)

PERIODICAL: Koks i khimiya, 1959, Nr 10, pp 5-8 (USSR)
ABSTRACT: The distribution of the total output of coal from the Donets basin indicated that gas and long flame, ie low rank coals constitute the largest proportion (35.7% about 29 million tons) of the coal mined. The structure of the consumption of the mined coal (table 1) indicates that gas coals are used mainly for power generation. As, however, a majority of consumers require lump coal, there is a technical and economic requisition of gas coals which were investigated and discussed in the paper. In 1958 the amount of fine gas coals amounted to 5 million tons (mainly burned in industrial and domestic grate). The available increase in 1965 to 9 million tons.

1. *Chlorophyll a* (Chl a) is the primary photosynthetic pigment in most plants and algae. It is a green pigment that absorbs light energy in the blue and red regions of the visible spectrum. Chl a is essential for the light-dependent reactions of photosynthesis, where it converts light energy into chemical energy in the form of ATP and NADPH.

TITLE: Effect of the non-steady state of flow upon the coefficient of the gas-dynamic resistance of gas mains

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy. Neft' i gaz, no. 7, 1961, 105-112

TEXT: Usually the case of a steady gas flow is assumed in planning and working of gas mains, while in practice non-steady flow occurs as a result of the change of consumption per unit time. It is therefore possible to apply the equations obtained for the steady flow to the analysis of gas-dynamic phenomena which occur in reality. The determination of the accumulation of the gas main is just as important from a practical point of view. The authors deal with new theoretical possibilities of considering the effect of the non-steady state of flow upon the coefficient of the gas-dynamic resistance. The calculations suggested are not difficult in practice. The mathematical formulation of the gas-dynamic resistance may be expressed by means of the following system of Eq.:

Card 1/8

Effect of the non-steady ...

S/152/61/000/001/007/007
B023/B064

$$\rho \frac{dw}{d\tau} = - \frac{\partial p}{\partial z} + \frac{2\tau_0}{r_0}; \quad (a)$$

$$\frac{\partial \rho}{\partial \tau} + \frac{\partial}{\partial z}(\rho w) = 0; \quad (b)$$

$$dq = di + Ad \left(\frac{w^2}{2} \right); \quad (c)$$

$$\frac{p}{\rho} = RTz \quad (d)$$

(1)

If both sides of Eq. (1a) are multiplied with $d\tau$ and then integrated from 0 to Θ ; Eq. (2) is obtained and the values contained therein are defined by (3). Θ is the time average.

$$\rho \frac{dw}{d\tau} = - \frac{\partial p}{\partial z} + \frac{2}{r_0} \tau_0, \quad (2)$$

rne

Card 2/8

Effect of the non-steady ...

S/152/61/000/001/007/007
B023/B064

$$\bar{p} = \frac{1}{\theta} \int_0^\theta p d\tau; \quad (a)$$

$$\bar{w} = \frac{1}{\theta} \int_0^\theta w d\tau; \quad (b)$$

$$\bar{\rho} = \frac{1}{\theta} \int_0^\theta \rho d\tau; \quad (c)$$

$$\bar{\tau}_0 = \frac{1}{\theta} \int_0^\theta \tau_0 d\tau; \quad (d)$$

$$\bar{\rho}_\theta = \frac{\frac{1}{\theta} \int_0^\theta \rho \frac{dw}{d\tau} d\tau}{\rho \frac{d\bar{w}}{d\tau}} \quad (e)$$

(3)

Card 3/8

Effect of the non-steady ...

S/152/61/000/001/007/007
B023/B064

After further calculations

$$\beta_{\infty} \bar{\rho} w d\bar{w} = -d\bar{p} - C_{f, \text{неч}} \frac{\rho w^2}{2} \cdot \frac{dz}{D}. \quad (8)$$

is finally obtained. An average can also be obtained in a similar manner for Eq. (1c):

$$d\bar{q} = d\bar{i} + A\beta_{\infty}' d\left(\frac{\bar{w}^2}{2}\right), \quad (9)$$

$$\bar{q} = \frac{1}{\Theta} \int_0^{\Theta} q d\tau; \quad (a)$$

$$\bar{i} = \frac{1}{\Theta} \int_0^{\Theta} i d\tau; \quad (b)$$

$$\beta_{\infty}' = \frac{\frac{1}{\Theta} \int_0^{\Theta} d\left(\frac{w^2}{2}\right) d\tau}{d\left(\frac{\bar{w}^2}{2}\right)} \cong \frac{\frac{1}{\Theta} \int_0^{\Theta} \frac{w^2}{2} d\tau}{\frac{\bar{w}^2}{2}}. \quad (c)$$

Card 4/B

S/152/61/000/001/007/007
B023/B064

Effect of the non-steady ...

Subsequently, Eq. (1b) is integrated with respect to z and

$q_w \int_z^0 (\partial q / \partial \tau) dz = f(\tau)$ (11) is obtained. After multiplying at both sides with πr_0^2 , and then with $d\tau$, integration from 0 to Θ ,

$$\bar{Q} = \frac{1}{\Theta} \int_0^\Theta Q_\tau d\tau = \frac{1}{\Theta} \int_0^\Theta \pi r_0^2 f(\tau) d\tau = \text{const.} \quad (13)$$

is obtained. Since, however $\bar{Q} = q_w S$, $q_w S = \text{const.}$ (14). Finally $\bar{p}/q = R\bar{z}$

(15) is substituted in (1d) for the period of the average. On the basis of (8), (9), (14), and (15), the gas-dynamic resistance at non-steady gas flow in the pipe line may be expressed by the following system of equations:

$$\beta_0 \rho d \left(\frac{\bar{w}^2}{2} \right) = -d\bar{p} - \bar{C}_{f, \text{нсж}} \frac{\rho \bar{w}^2}{2} \cdot \frac{dz}{D}; \quad (a)$$

$$\bar{p} \bar{w} S = \text{const.} \quad (b)$$

Card 5/8

Effect of the non-steady ...

S/152/61/000/001/007/007
B023/B064

$$d\bar{q} = d\bar{i} + A\beta'_0 d\left(\frac{\bar{w}^2}{2}\right); \quad (c)$$

$$\frac{\bar{p}}{\rho} = R\bar{T}\bar{z}. \quad (d)$$

(16)

The system (16) differs from the solution of the previous paper of the authors (Ref. 1) in-so-far as the equations of motion and energy contain the constant coefficients β_0 and β'_0 for the given average. To determine the effect of the non-steady state of the gas flow upon the coefficient of the gas-dynamic resistance, the solutions for the steady gas flow are used and a corresponding correction β_0 is made for the inert term, and, instead of p_0 and p_1 their average values are substituted in the chosen period of time Θ . In the following the authors give examples which show that the non-steady state depending on the change of velocity in time may both increase and reduce the effect of the inert term and the coefficient of the gas-dynamic resistance. Only in the special case when $\beta_c = 1$, the operational conditions of the gas main are analogous to the conditions

Card 6/8

Effect of the non-steady ...

S/152/61/000/001/007/007
B023/B064

prevailing at a steady flow with respect to the effect of the inert term. The coefficient β_0 may be determined as follows: First a diagram is plotted of the change of w as a function of time, and then the differential quotient

$\frac{dw}{d\tau}$ is determined by graphical differentiation. Below the diagram, the

dependence $q = q(\tau)$ is graphically represented. The ordinates of the former diagram are multiplied with the ordinates of the latter and thus the quan-

tity $q \frac{dw}{d\tau}$ is found. On the basis of the last curve, $\int_0^{\theta} q \frac{dw}{d\tau} d\tau$ is found by

graphical integration. The average quantities q and $\frac{dw}{d\tau}$ are obtained from

the diagrams $\frac{dw}{d\tau} = f(\tau)$ and $q = q(\tau)$ by way of graphical integration. On

the basis of these data it is not difficult to obtain β_0 . The methods shown are also applied by the authors to determine the accumulating capacity of the gas mains. Thus, accumulation for the period τ is expressed by the

Card 7/8

S/152/61/000/001/007/007
B023/B064

Effect of the non-steady ...

equation $G = (G_0 - G_T)\Theta$ (21) and the total accumulative power by

$G = G_0\Theta_1$ (22). There are 3 Soviet-bloc references.
